FOUR REQUIRED TESTS - ALL PASSED

Delivery Updates: test evidence

Actual device-targeted Firebase messages, observed handlers, and visible results. No application code or configuration changes were needed during testing.

Device: Pixel 10 Pro XL emulator (sdk_gphone16k_arm64), Android 17 / API 37.
Permission: authorized; Android POST_NOTIFICATIONS granted.
Sender: Firebase Console in Safari, only the current emulator token selected.
Project: delivery-updates-ee90f; package com.example.delivery_updates.

Known payload reused for T1-T3

```
notification.title: Order #1001 is out for delivery
notification.body: Your driver is on the way.
data.action: update_ui
data.asset: promo
```

Test	Expected handler	Observed result	Result
T1	onMessage	Count 2; title and image updated.	PASS
T2	onMessageOpenedApp	Count 3; notification tap returned to the existing process.	PASS
T3	getInitialMessage	New process; count 1; delivery UI loaded.	PASS
T4	onMessage	Count 2; rejection shown; title/image preserved.	PASS

T4 variation: only data.asset changed to unknown. The previous title/image region is pixel-identical in the before/after screenshots.

Count note: one earlier receipt existed before T1. Counts progressed 2, 3, then reset to 1 at T3 and increased to 2 at T4.

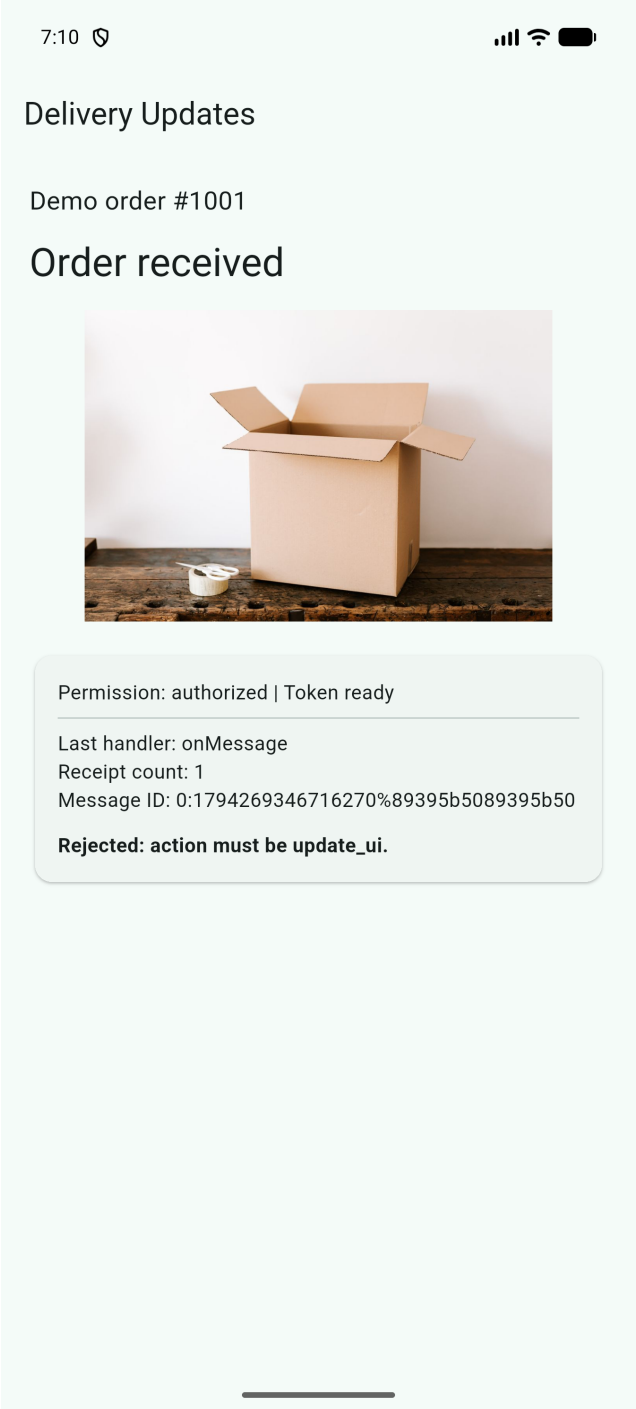

Scope: one Android emulator. Screenshots are authentic captures; captions are external annotations. Full device tokens and credentials are omitted. Existing campaigns were not edited or published by this test session.

T1 - PASS - 7:11:57 PM EST

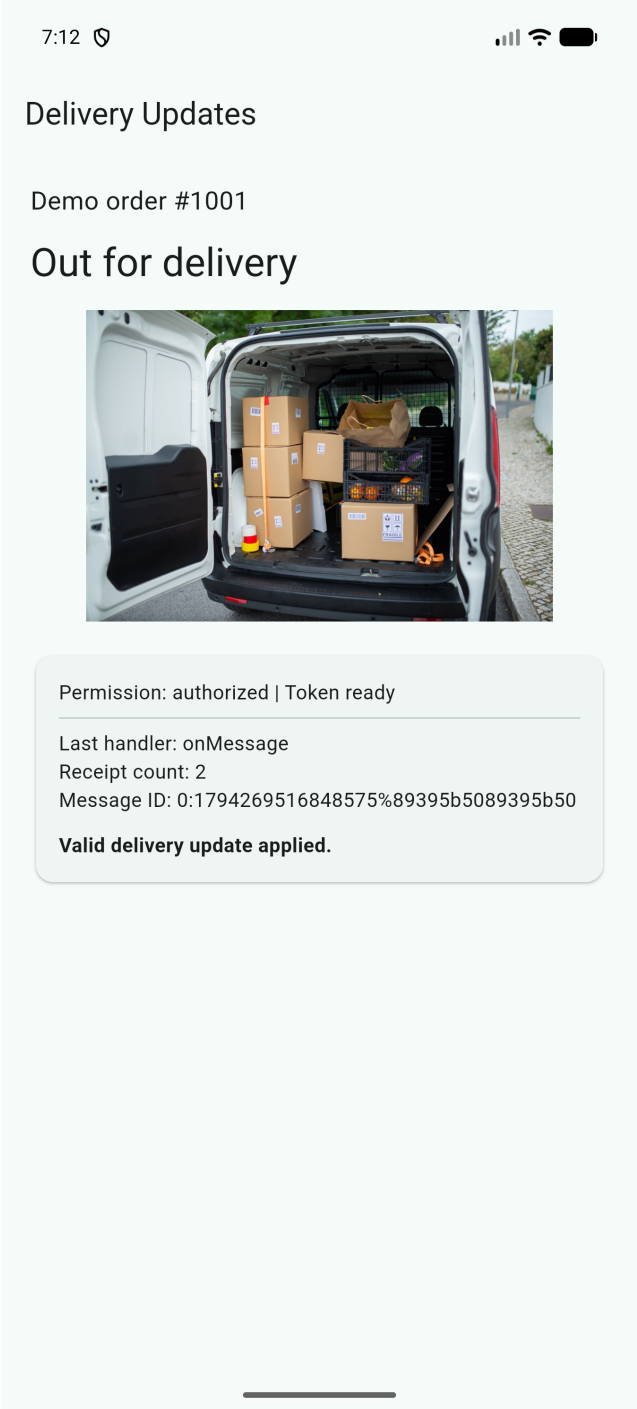

Foreground receipt

Kept the app visible and sent the valid payload to its current device token.

Before: existing app state

After: valid foreground receipt

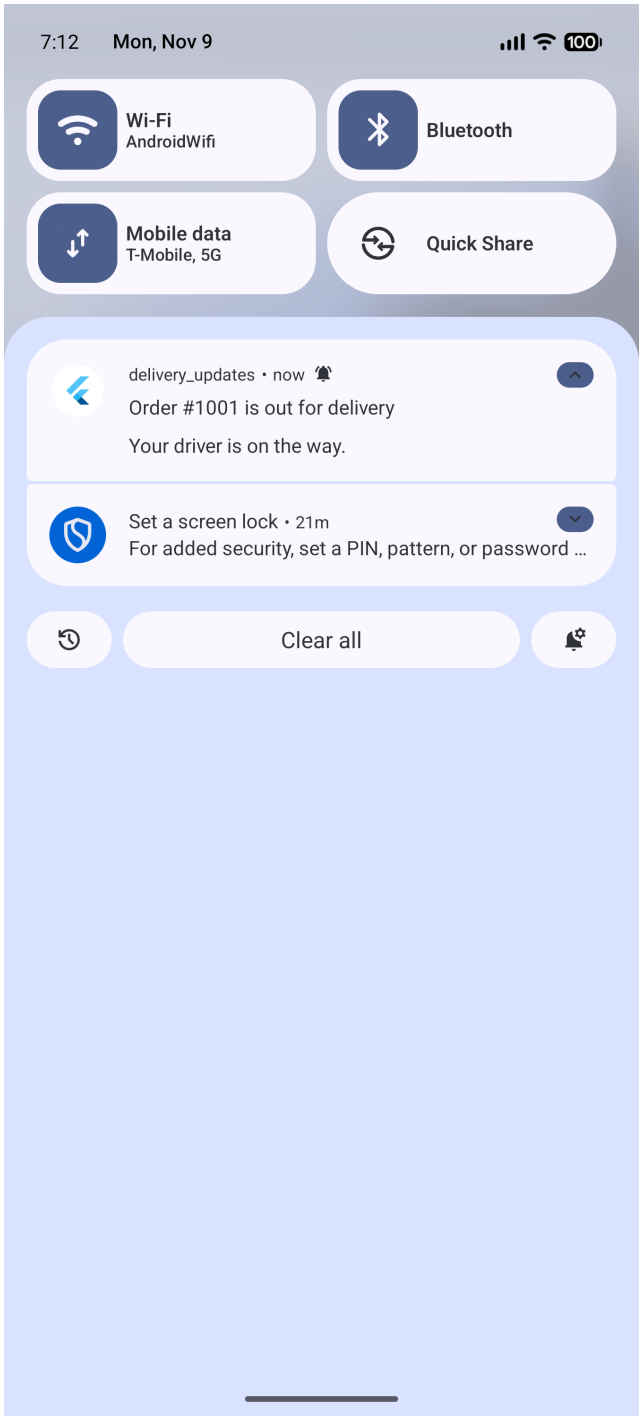

Observed: onMessage; receipt count 2. The app already had one earlier receipt before this test. T1 is the fresh event at count 2.

T2 - PASS - 7:13:12 PM EST

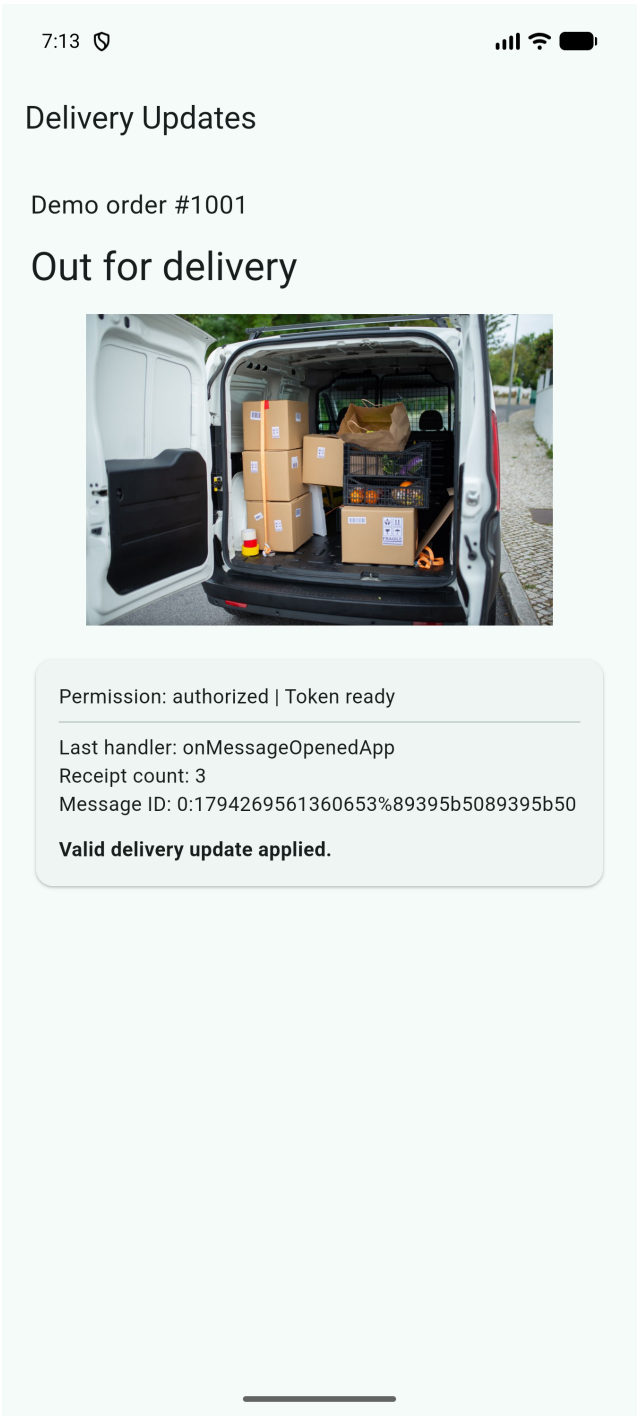

Background notification tap

Pressed Home, sent the same valid payload, opened the notification shade, and tapped the notification.

Delivered while app was backgrounded

After tapping the notification

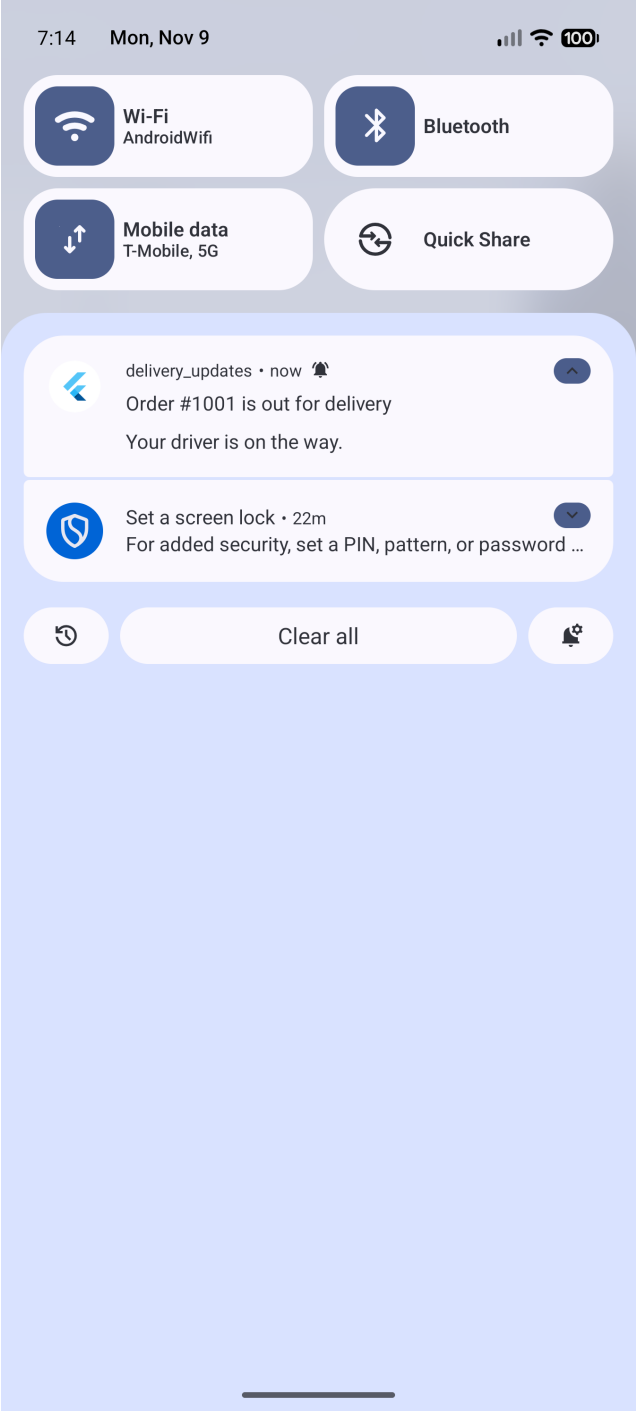

Observed: onMessageOpenedApp; receipt count 3. The same app process (PID 4248) resumed. The new handler, count, and message ID establish a fresh event.

T3 - PASS - 7:14:43 PM EST

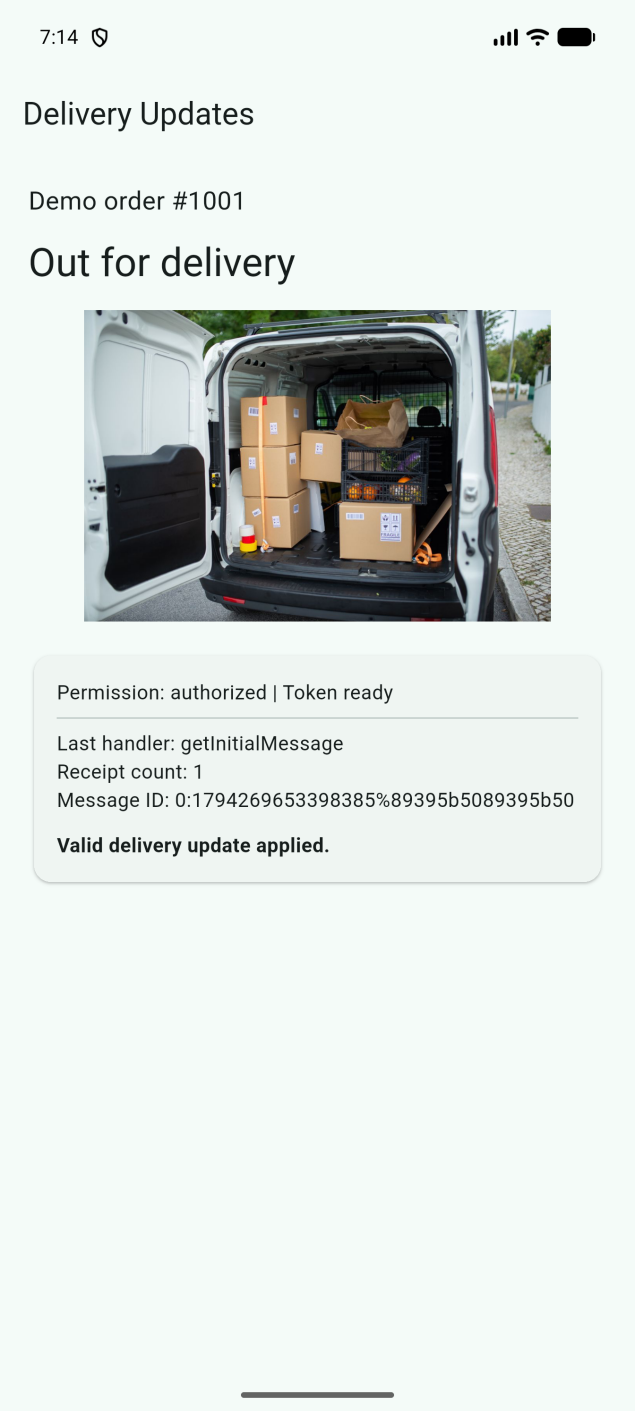

Notification-triggered cold start

Dismissed the app from recents, verified its process ended and stopped=false, sent the same valid payload, then tapped its notification.

Notification delivered before app launch

Cold start from the notification tap

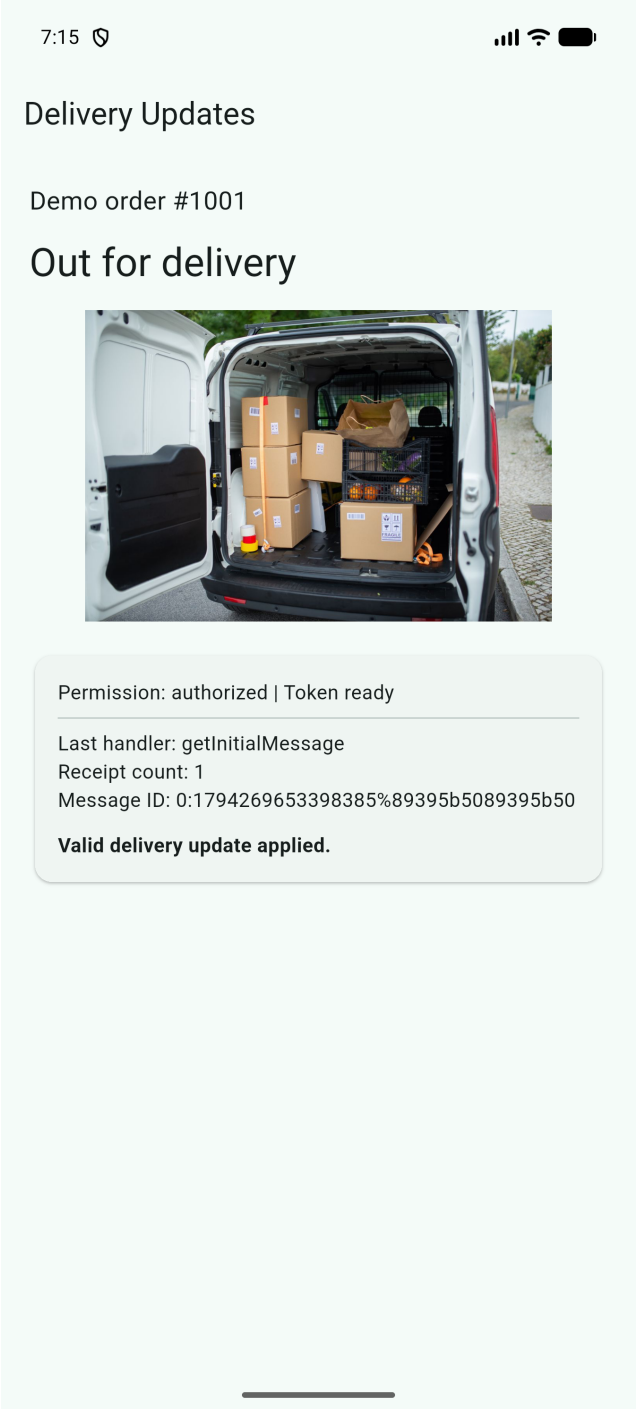

Observed: getInitialMessage; receipt count 1. Normal recents dismissal ended the app process. No Settings force-stop, launcher-icon start, or flutter run was used.

T4 - PASS - 7:15:34 PM EST

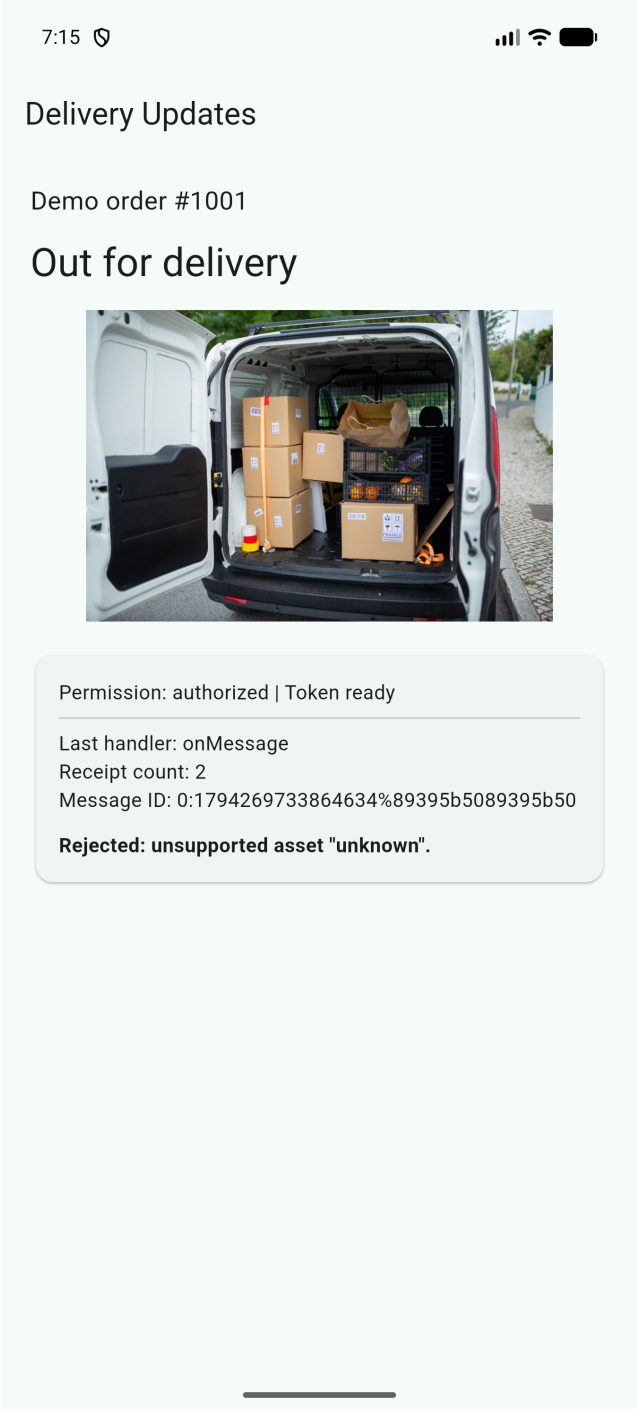

Unsupported asset rejected

Kept the app foregrounded and changed only data.asset from promo to unknown.

Before: accepted delivery content

After: invalid asset safely rejected

Observed: onMessage; receipt count 2. The title/image area is pixel-identical before and after (original screenshot region x=0..1344, y=160..1350).
